

The complete range  
**TECE** drainline shower channels

**TECE:**  
Intelligente Haustechnik

## TECEdrainline shower channels

TECEdrainline shower channels clear the bathroom of any items that get in the way, such as shower tubs and cubicles, and make it possible to uniformly design the floor. This gives rise to barrier-free bathrooms of generous proportions – real rooms for living in, in fact. TECEdrainline shower channels come either with stainless steel / glass covers or with the "plate" tileable channel where a plain slot in the floor is the only thing that can be seen.

A photograph of a modern bathroom vanity. The vanity features a large, rectangular glass top that is held up by a robust, stainless steel support structure. The support is a thick, rectangular block with a polished finish. The glass top is transparent, reflecting the surrounding environment, including a vase with dried flowers and some toiletries on the counter. The background shows a white wall and a dark, textured wall on the right. The overall aesthetic is clean, minimalist, and high-end.

Glass in the  
bathroom –  
timeless and high-class ...

Still tough despite the transparent look: The safety glass sits on a particularly robust stainless steel support.

### TECEdrainline glass

- Straight lengths 700, 800, 900, 1000, 1200, 1500 mm (nominal lengths)
- Visible width of 52 mm
- Withstands a 300 kg (load class K3)

The article numbers for your order and the required accessories can be found on pages 22 to 24 of this brochure.

Glass white

Glass green

Glass black

Like the "plate" tileable channel, the glass cover forms an enclosed surface that integrates seamlessly into the bathroom floor. The shower water flows off easily through a narrow drainage opening around the channel.

TECE provides the glass cover in standard colours green, black and white. The round-edged safety glass is permanently fixed to the underlying robust stainless steel support by means of a special adhesive.

## **TECE**drainline "plate" – tileable, elegant, unobtrusive ...

Thanks to the "plate" and "plate II" tileable channel, the TECEdrainline shower channel can be perfectly fitted into the flooring.

The tileable channel can also be provided for the angled channel in various dimensions (see page 23).

**TECE**drainline "plate"

"plate"

"plate II"

Set fresh nuances – with  
**TECE**drainline stainless steel grates.

Stainless steel is a material which is typically used in the bathroom: authentic, permanent and conveying a sense of value. The stainless steel grates are available in a variety of designs – and either brightly polished or mat brushed.

### Angled channels in stainless steel

Unique - the TECEdrainline angled channels range: A choice of two design variants is available, and also the “plate” tileable channel. The grates are available with an arm length of up to 1200 mm and can be loaded at up to 300 kg (load class K3).

The “quadratum” design grate in brushed stainless steel has been tested and approved to DIN 51097 by TÜV Rheinland regarding its slip-resistance properties. The certificate can be viewed at [www.tece.de](http://www.tece.de).

## TECEdrainline stainless steel grates

Design "basic"

Design "lines"

Design "drops"

Design "royal"

Design "quadratum"

Design "organic"

Design "steel II"

- Straight lengths 700, 800, 900, 1000, 1200 and 1500 mm (system length)
- Visible width of 66 mm
- Custom lengths from 400 mm up to a maximum of 1500 mm are also available at short notice.
- For straight grates, all designs can be supplied with a bright polished or brushed stainless steel surface.
- For angled channels, the designs "steel II" and "basic" can be supplied with a polished stainless steel finish.

The article numbers for your order and the required accessories can be found on pages 22 to 24 of this brochure.

Natural stone floors have their own unmistakeable charm. However, it is often somewhat unpractical to install a shower channel in this type of floor. TECE has therefore developed a special channel for natural stone floors that makes installation and sealing far easier. A change has been made to the appearance too: While before, narrow stainless steel edges bordered the drain opening, only a slit is now visible in the natural stone.

## "Invisible" shower channel

**TECE** drainline channel for natural stone

## TECEdrainline – new feeling of freedom in bathroom design.

TECEdrainline shower channels open up new design options in bathroom architecture – and bathroom planners take advantage of this new freedom. Thus stainless steel channels can not only be fitted between the dry and wet areas but also, for instance, directly at the wall.

Close wall installation of the TECEdrainline in the "steel II" grate design: A mere 1% gradient to the wall suffices for directing the water into the shower channel.

Standard installation of TECEdrainline in the entry to the shower as a wet-to-dry area transition featuring the "quadratum" grate design.

## TECEdrainline – mounting variants

Further design options are the use of an angled channel or two parallel channels.

Installation with angled channel and the “basic” grate design.

Fitting two parallel “plate” tileable channels, which can be faced with the particular tiles.

### Edge turned up by the factory saves time.

A special channel for installation at the wall immediately enhances the TECEdrainline range: The new stainless steel channel is equipped with a wall flange which has already been turned up at the factory and is available in all the standard lengths from 700 to 1500 mm. All design covers, mounting feet and outlets can be used without limitation. The result: Particularly when there is a large number of channels to be installed at the wall, time is saved and the work on-site is minimised. The tile finishing edge of 20 mm also offers more flexibility for easier installation at the wall.

Incidentally: Nothing has changed with the standard channel. It can still be turned up on-site when needed, just as before.

- |                             |                             |                                    |
|-----------------------------|-----------------------------|------------------------------------|
| 1. "plate" tileable channel | 5. Tile adhesive            | 9. Removable protective film       |
| 2. Channel body             | 6. Composite seal           | 10. Screed                         |
| 3. Tile cover               | 7. Seal System sealing tape | 11. PE foil                        |
| 4. Elastic grouting         | 8. Channel flange           | 12. Drainbase sound insulation mat |

## TECEdrainline standard channel – installation

Setting the height of the horizontal channel using the assembly feet, connection of the rotatable outlet to a DN 40, DN 50 or DN 70 drain pipe.

Complete underfilling with screed produces stable anchoring of the channel body and outlet with the unfinished floor.

Seal System adhesive tape: the butyl adhesive tape is a self-adhesive sealant and ensures a water-tight bond between the flange and the screed.

The final step before tiling is the application of the composite seal.

The length of the channel body is tailored to the standard dimensions of TECEdrainline grates.

- Lengths L for straight channels from 711 to 1511 mm (visible dimension after assembly L - 60 mm)
- Lengths L for angled channels from 946 x 946 to 1246 x 1246 mm (visible dimension after assembly L - 70 mm)
- Option of installation close to the wall

### TECEdrainline natural stone channel

TECE has developed a special channel for natural stone floors. Consisting of a channel body with a support for the natural stone covering and a 4 centimetre wide flange around the outside. This makes installation and sealing far easier. The stone slabs can therefore be laid using both a thin-bed and thick-bed method.

- Channel and stainless steel support as set
- Lengths  $L$  for channels from 735 to 1535 mm (visible dimension after assembly  $L - 89$  mm)

The range includes five drains for different requirements and structural features. The models match all the shower channels in the TECEdrainline range.

- Drain DN 40 with a particularly low assembly height of 68,5 mm (total assembly height to upper edge of finished floor) with 0.6 l/s drainage capacity
- DN 70 drain with particularly high drainage capacity of 1.5 l/s with standard-compliant sealing water height in accordance with DIN EN 1253, ideal for power showers
- Vertical drain for floor bushing – optionally also with fire protection set for fire resistance classes EI 120

		Total assembly height with upper edge of finished floor	Drain assembly height
Horizontal drains	 DN 40	 <b>Extremely flat drain</b> 0.6 l/s	min. 53 mm*
	 DN 50	 <b>Flat drain</b> 0.8 l/s	min. 81 mm
	 DN 50	 <b>Standard based drain</b> 0.9 l/s	min. 106 mm
	 DN 70	 <b>Drain with maximum drainage capacity</b> 1.5 l/s	min. 134 mm
Vertical drains	 DN 50	 <b>Vertical drain</b> 1.4 l/s	min. 51 mm*
		<ul style="list-style-type: none"> <li>■ FireStop fire protection set for the vertical drain</li> <li>With the FireStop fire protection set for TECEdrainline shower channels, TECE is offering safety with fire protection – up to fire resistance class EI 120 in accordance with DIN EN 13501-3.</li> </ul>	

\* without assembly feet

## Seal System – certified safety

### Seal System – the new sealing standard for TECEdrainline shower channels

Example of Seal System sealing of a TECEdrainline shower channel with a certified sealing product: (1) screed, (2) channel flange protective film, (3) Seal System sealing tape, (4) first layer of composite seal, (5) second layer of composite seal.

### What is Seal System?

Seal System offers TECE installers and tilers tested safety when connecting composite seals to TECEdrainline shower channels and TECEdrainpoint S floor drains. The testing was done by the independent testing institute Kiwa TBU, and was performed according to the building authorities test criteria applicable in Germany (PG-AIV).

More than 50 sealing products from well-known manufacturers were successfully tested and certified. For this purpose, the functional safety (water-tightness) of the composite sealing products was tested with the TECE drainage products. A certificate is available for each product which passed the test.

A list of all the certified composite seals can be called up at [www.sealsystem.net](http://www.sealsystem.net).

### The TECEdrainline Seal System consists of the following components:

1. TECEdrainline shower channel
2. Seal System sealing tape
3. One of the 50 tested and certified sealing products

## The new standard reference work on composite sealing

### Assured planning and handling of composite seals at the shower channel and point drain

A standard work on composite sealing: Point. Line. Sealed! tells you all about certified composite seals in book form. Experienced practitioners from the trade and industry have gathered all there is to know about composite seals in 272 pages. **This book is only available in German language.**

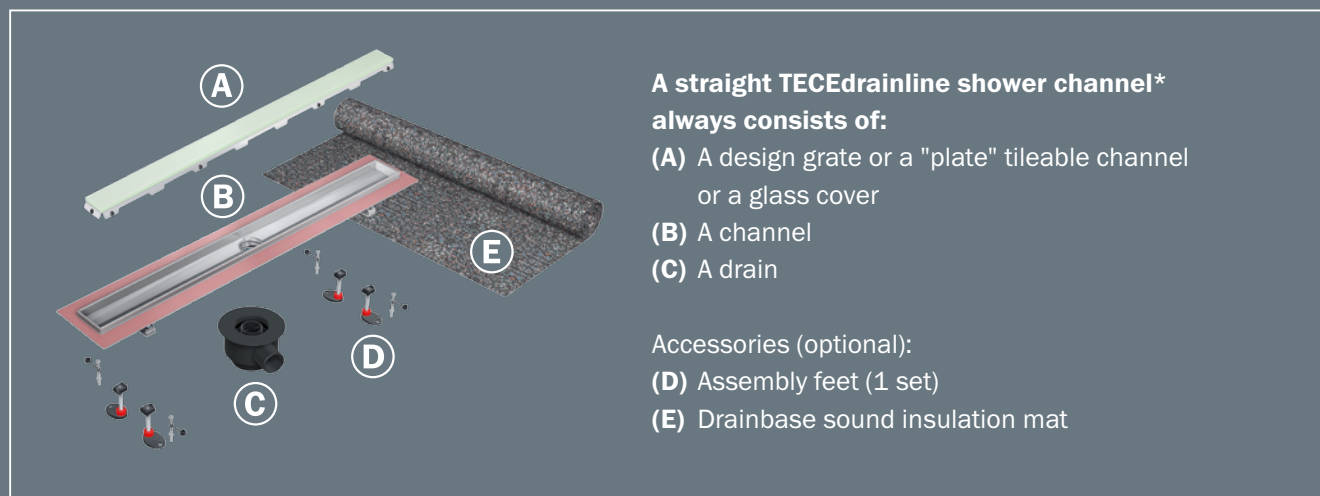

## Point. Line. Sealed!

### The new standard reference work on composite sealing

The new 272-page standard reference work on certified composite sealing. Packed with information to help with the planning and installation of sealing systems in sanitary facilities, notes on the waterproofing of buildings and floor structures incorporating drainage solutions, more than 100 basic testing certificates issued by Kiwa TBU in Greven relating to point and linear drains and explanatory notes on the relevant standards. Point. Line. Seal! by Martin Krabbe, Reinhold P. Bäder et al. Can be obtained from booksellers and on the Internet under ISBN 978-3-00-040275-3 at the price of 36 euros incl. VAT.

## How to order:

\* The natural stone channel is supplied with stainless steel support. The design grates and "plate" (A) tileable channel are not suitable for the natural stone channel.

Seal System sealing tape for TECEdrainline, self-adhesive, roll 10 m 	6 600 19

### Cleaning and hygiene

The drainage channel is made of stainless steel, is closed without corners or cavities which cannot be reached, and there are no screws or threaded components on which hair or dirt can be trapped. It is therefore hygienic and easy to clean. If the outlet should ever become blocked, the immersion pipe can be removed (2nd fig. from right) and a conventional cleaning coil can be used to clear the blockage. A marking on the inside of the drain shows the location of the drain outlet for this purpose.

### Penetrating odour? Not a chance!

#### The two-stage TECEdrainline membrane odour trap

Odours produced in seldom-used sanitary equipment because the odour trap has dried out? TECEdrainline membrane odour trap tackles the problem in an innovative way: The immersion pipe of the odour trap has a sealing lip membrane on the inside. This membrane minimises the evaporation of the sealing water - unpleasant odours cannot arise. The system can be retro-fitted to any TECE shower channel and also acts as a barrier against vermin and foam.

# Drainage technology to a standard – made by TECE.

TECE is one of the few manufacturers to have allowed their drainline shower channel to be tested by the LGA Würzburg according to the applicable standards for drainage equipment inside buildings. This means more product liability security for planners and installers. Among those things tested were the drainage capacity, sealing water height and temperature resistance of the different drains; the load-bearing capacities of the grates were also part of the test.\*

\* The grates "plate" and "basic" were tested in combination with the standard, vertical and max drains.
